What types of problems can computers solve?

What types of problems can computers solve?

Easy for Computers

- Math problems
- Working with lots of data
- Games with formal rules

Hard for Computers

- Recognizing spoken words
- Identifying objects in images
- Understanding data

What types of problems can computers solve?

Easy for Computers

- Math problems
- Working with lots of data
- Games with formal rules

Hard for Computers

- Recognizing spoken words
- Identifying objects in images
- Understanding data

Computers excel at tasks where the key representations of the data are well defined

Three flavors of “AI”

- Rule based systems
- Classic Machine Learning
- Representation Learning

Rule based systems

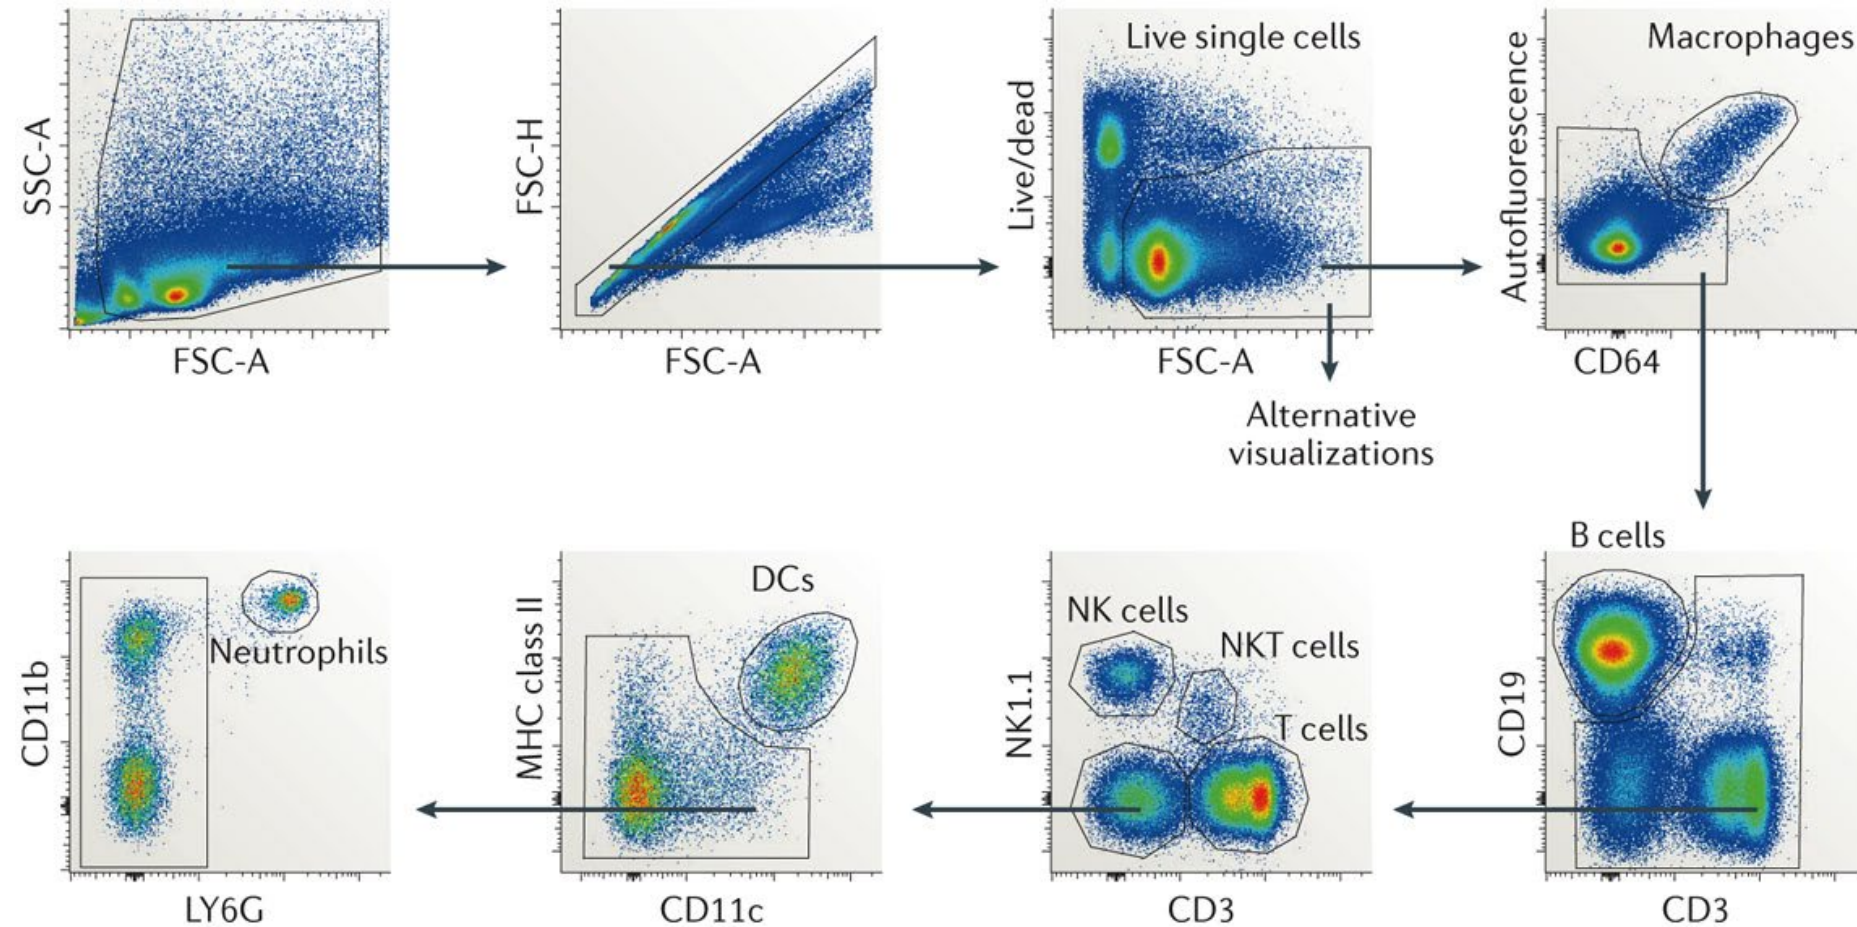

- If condition X then output Y
- Relies on the programmer providing all necessary information for making a decision including:
 - The data in a simple format
 - The exact decision method and boundary values are provided by the programmer
- Example: FACS sorting

Example FACS Sorting

Example FACS Sorting

a Manual gating

Rule based systems

- “The difficulties faced by systems relying on hard-coded knowledge suggest that AI systems need the ability to acquire their own knowledge, by extracting patterns from raw data. This capability is known as machine learning.”

Classical Machine Learning

- The program optimizes a small number of parameters (learning)
- Relies on the programmer providing some structure for making a decision including:
 - The data in a simple format
 - A general framework for decision making is provided by the programmer
 - Some feedback mechanism for how far off a prediction is from the truth
- Example: Linear Regression

Linear Regression

Linear Regression

- Program makes a guess for what the parameters (slope and intercept) should be
- Program uses the formula $\text{residuals} = \text{actual } y - \text{predicted } y$ for each point to assess how well it predicted
- Program adjusts parameters to minimize the residuals

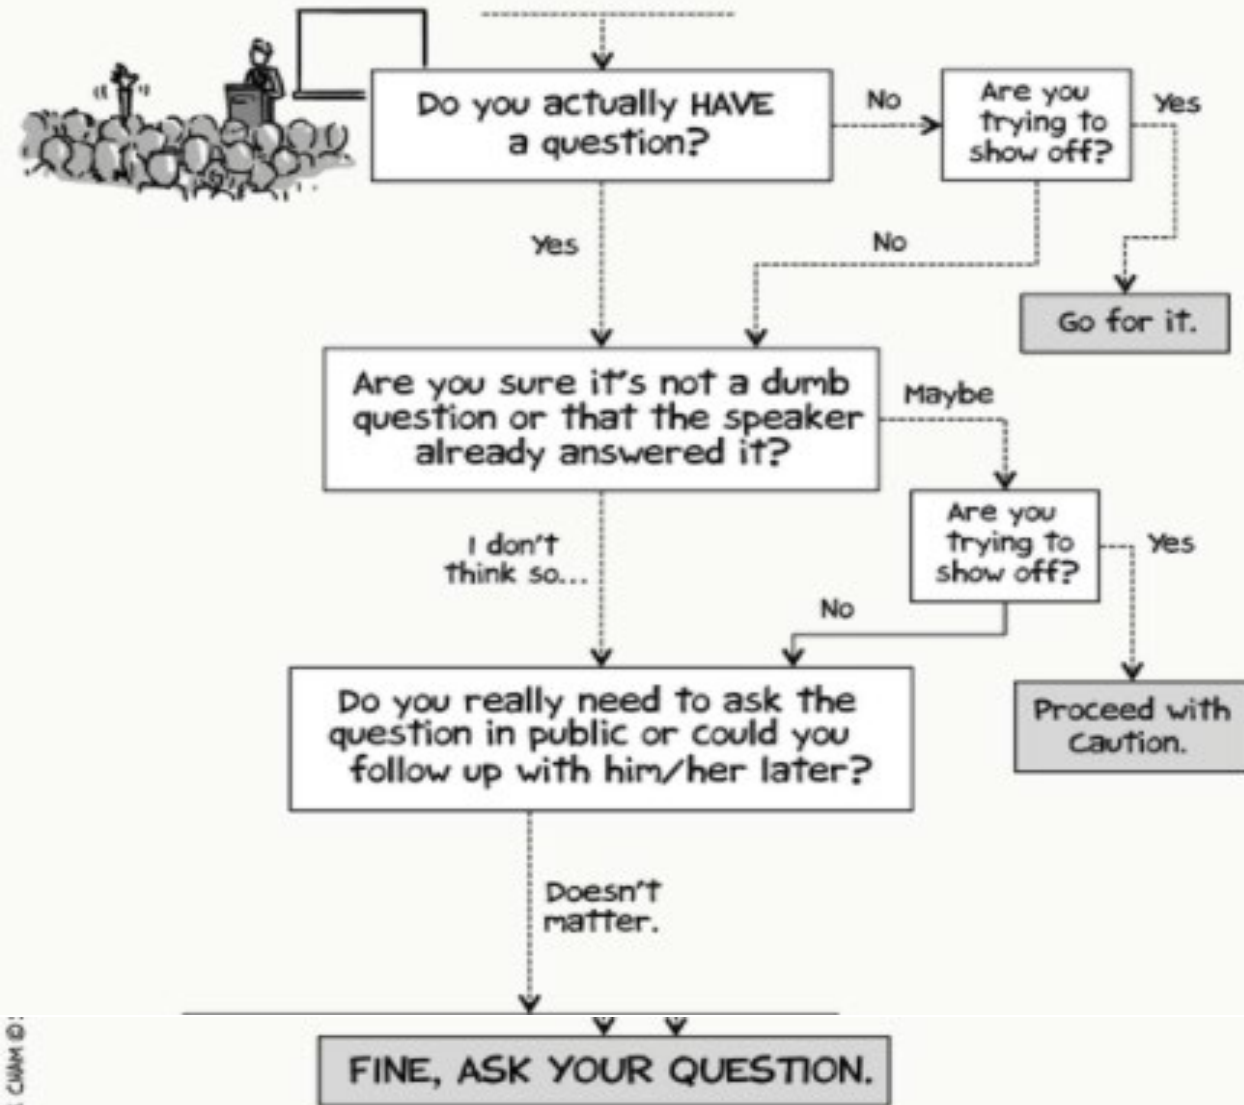

Classical Machine Learning

- The program optimizes a small number of parameters (learning)
- Relies on the programmer providing some structure for making a decision including:
 - The data in a simple format
 - A general framework for decision making is provided by the programmer
 - Some feedback mechanism for how far off a prediction is from the truth
- Example: Linear Regression
- Example: Random Forest (ilastik)

How ilastik works

- Random Forest of Decision Trees

Should you ask a Question during Seminar?

Decision Trees

- Trying to figure out if pixel * is a puncta or background
- We know the Intensity of * (range is 0-255)
- We know the position of * and the intensity of all of the pixels around it
- What would be a good first feature to consider to help decide if * is a puncta or background?

Decision Trees

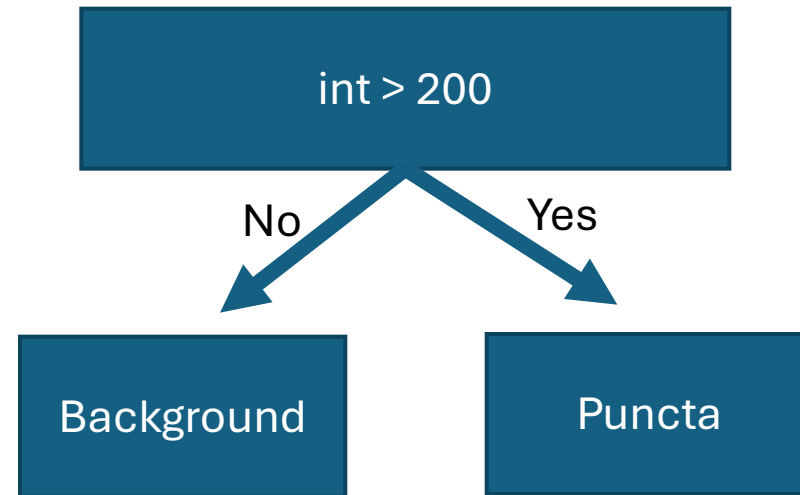

- Trying to figure out if pixel * is a puncta or background
- We know the Intensity of * (range is 0-255)
- We know the position of * and the intensity of all of the pixels around it
- What would be a good first feature to consider to help decide if * is a puncta or background?

Is * bright enough to be a puncta?

Decision Trees

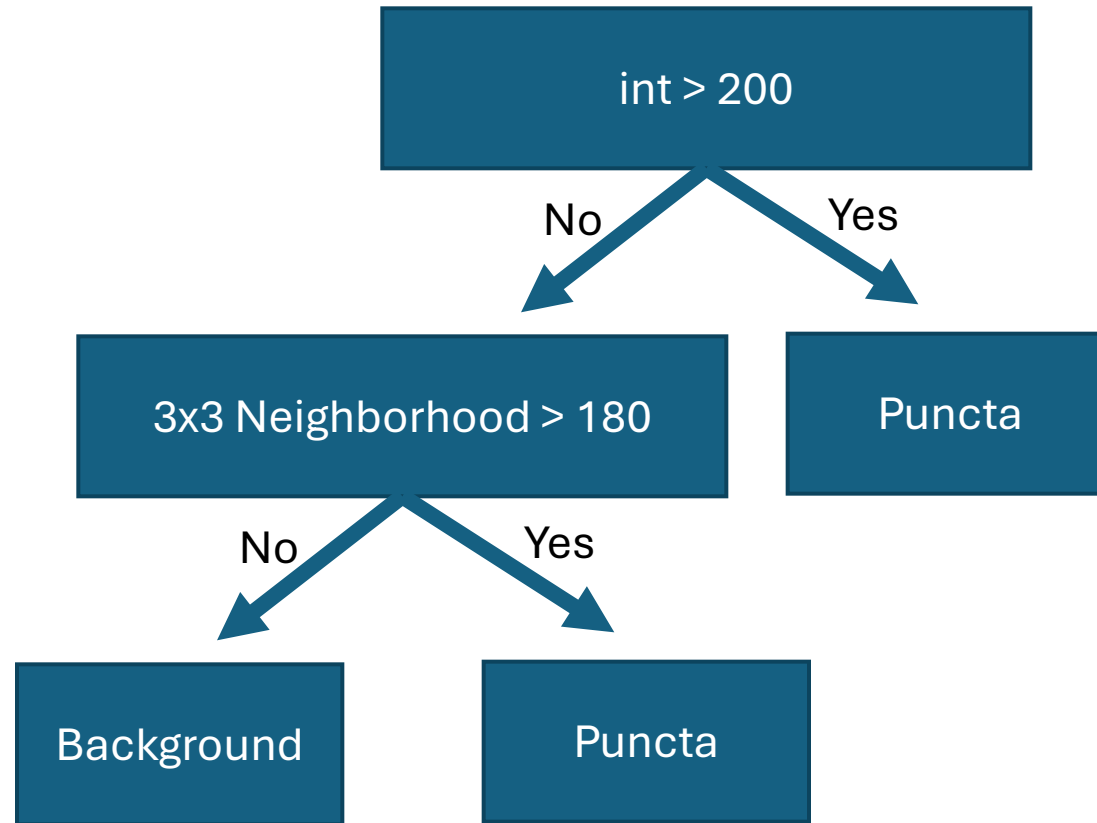

Try an intensity cutoff

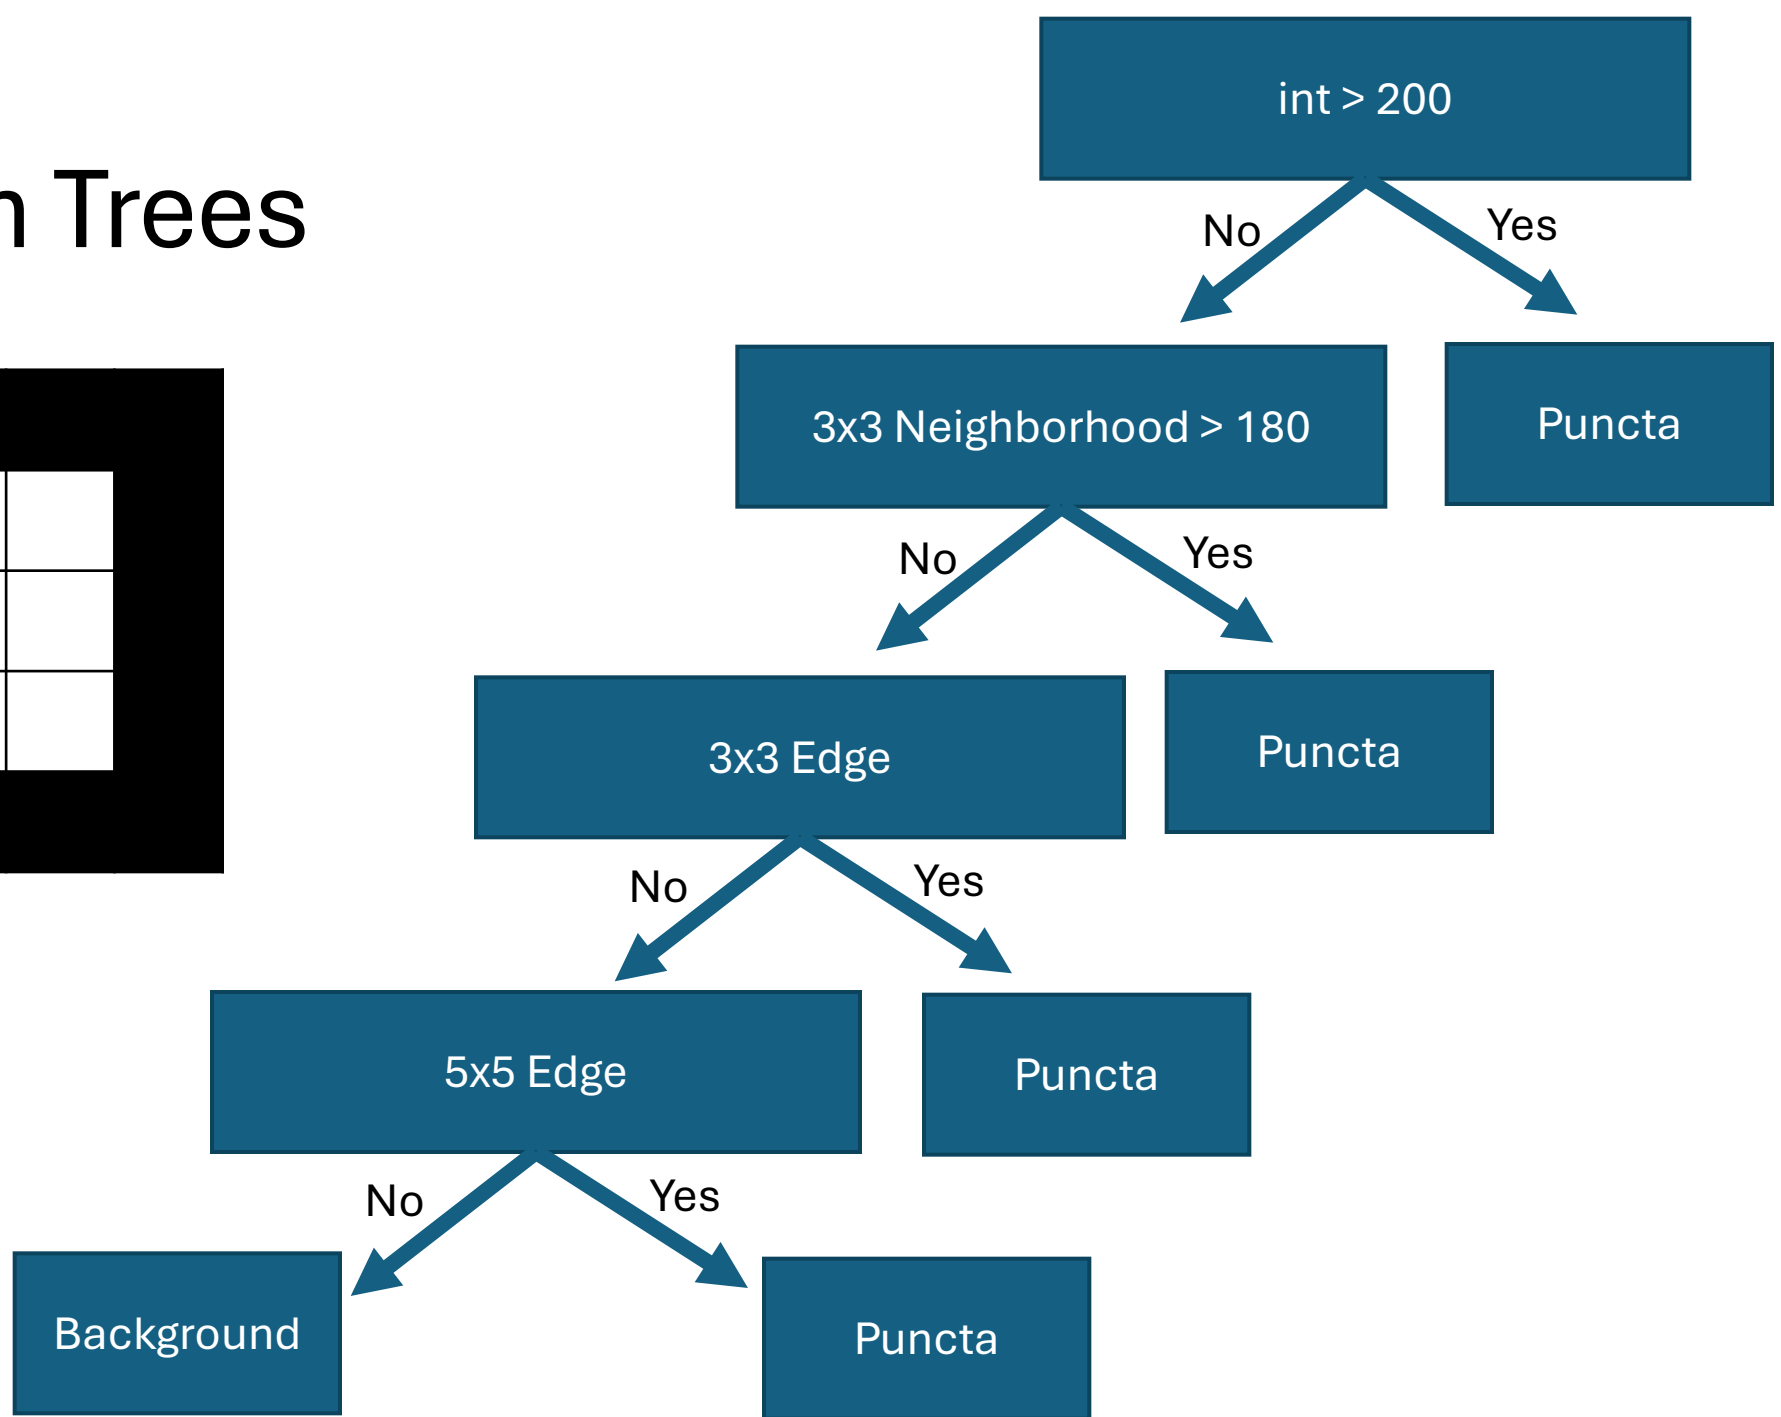

This is the same as traditional thresholding, but we can do better

Decision Trees

Decision Trees

Random Forest

- ilastik uses 100 decision trees that are randomly generated to be slightly different from each other
- Each one "votes" for whether a pixel is foreground or background

Viewing Features in Feature Selection Window

ilastik - C:/Users/savag/Desktop/ilastik_PSD95.ilp - Pixel Classification

Project Settings View Help

1. Input Data

2. Feature Selection

(Selected 37 features)

Select Features...

3. Training

4. Prediction Export

5. Batch Processing

Current View: 16772 #3 Vglut1 Image 1-1.tif (red)

Features:

- Raw Data (display only)
- Gaussian Smoothing ($\sigma=0.3$) in 2D
- Gaussian Smoothing ($\sigma=0.7$) in 2D
- Gaussian Smoothing ($\sigma=1.0$) in 2D
- Gaussian Smoothing ($\sigma=1.6$) in 2D
- Gaussian Smoothing ($\sigma=3.5$) in 2D
- Gaussian Smoothing ($\sigma=5.0$) in 2D
- Gaussian Smoothing ($\sigma=10.0$) in 2D
- Laplacian of Gaussian ($\sigma=0.7$) in 2D
- Laplacian of Gaussian ($\sigma=1.0$) in 2D

Classical Machine Learning

- The program optimizes a small number of parameters (learning)
- Relies on the programmer providing some structure for making a decision including:
 - The data in a simple format
 - A general framework for decision making is provided by the programmer
 - Some feedback mechanism for how far off a prediction is from the truth
- Example: Linear Regression
- Example: Random Forest (ilastik)

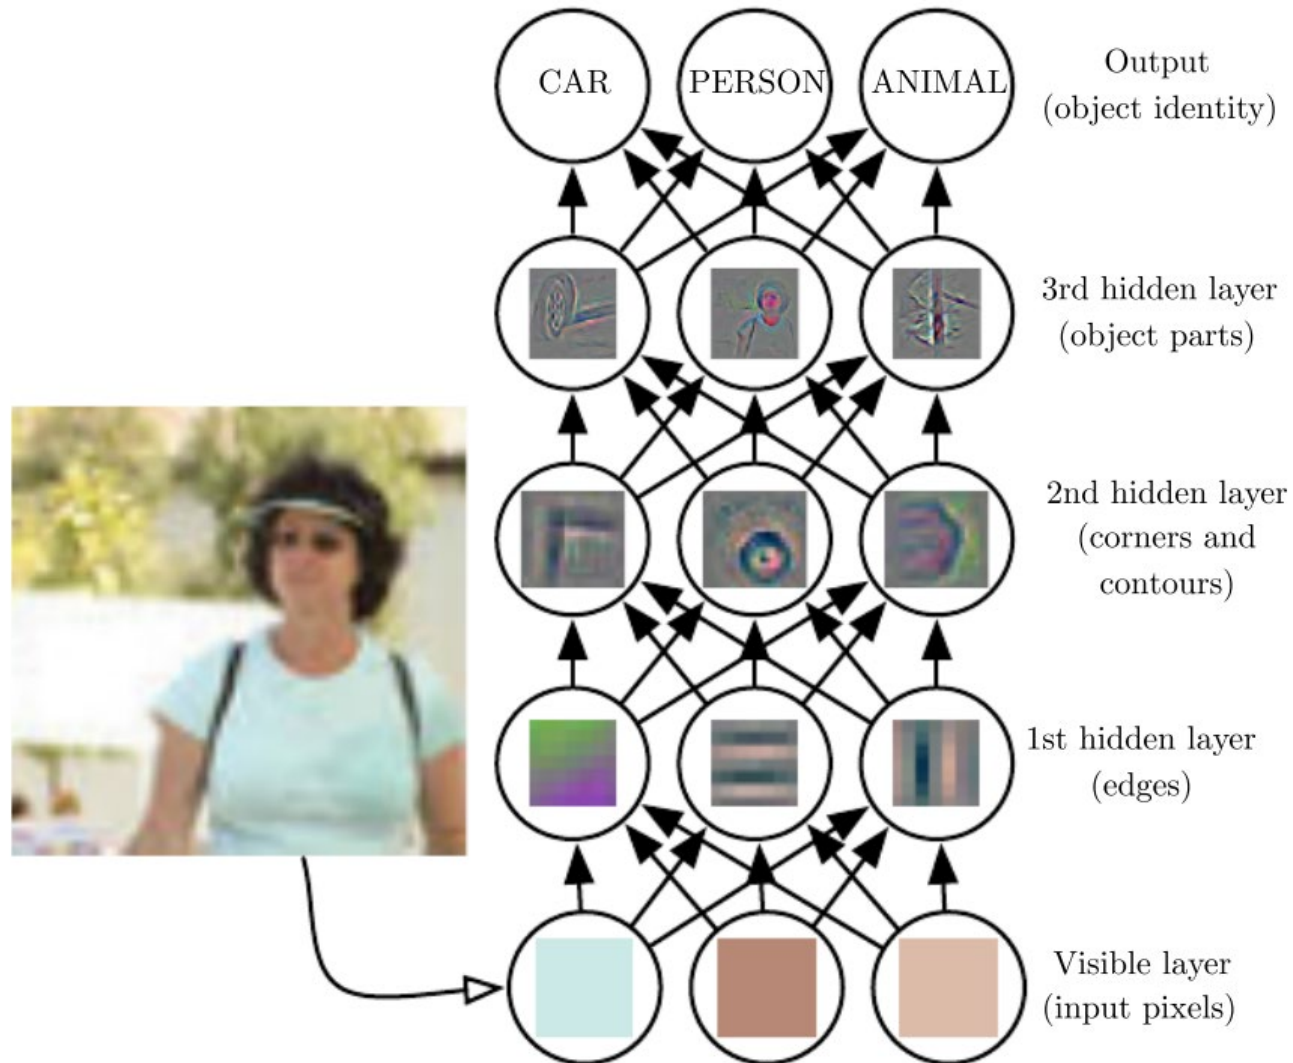

Representation Learning

- For some applications, it is difficult to say which features of a data set are important for a decision
- We may want the algorithm to discover novel combinations of features that could explain the data better than features we have as input
- We may want to eliminate as much of our own bias as possible

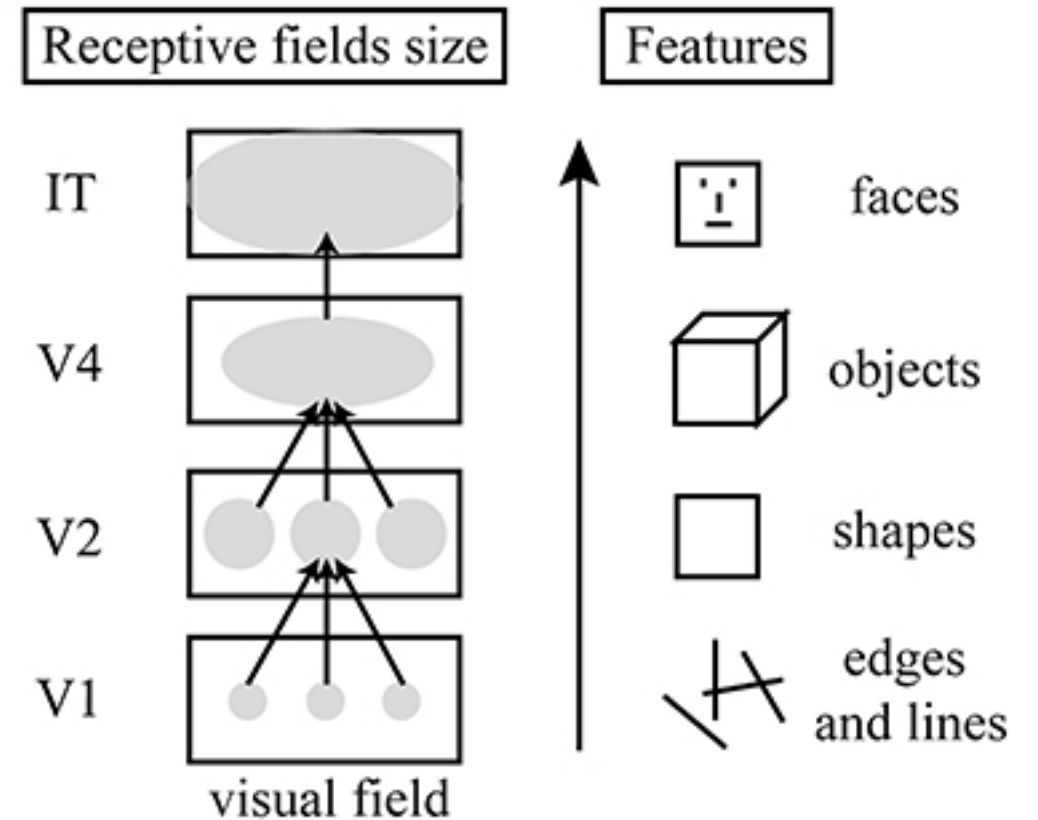

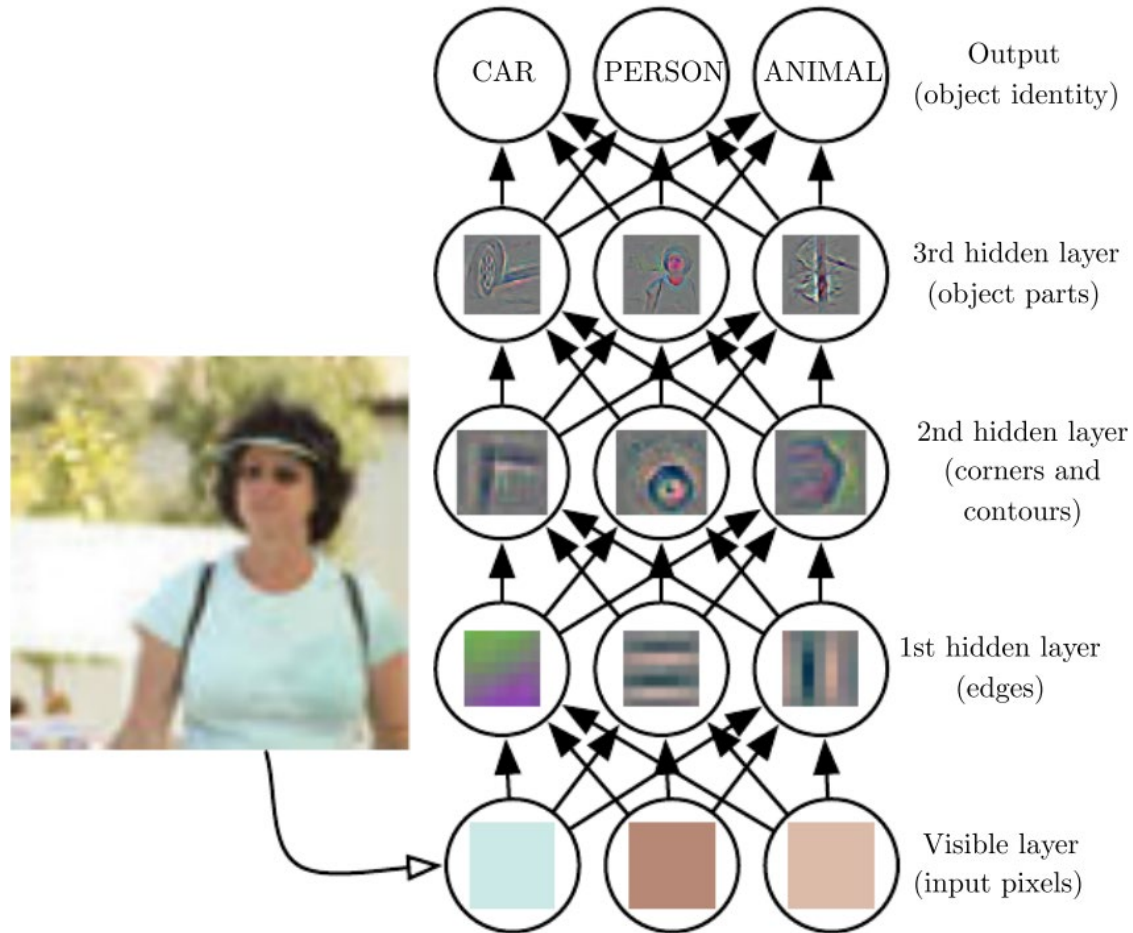

Representation Learning

- The program not only learns parameters, but learns which representations of the data are most useful for decision making
- Relies on the programmer providing a minimal framework for making a decision including:
 - The data in a complex, raw format
 - Some structure for how many features to learn and how they should be connected to each other
 - Some feedback mechanism for how far off a prediction is from the truth
- Example: Artificial Neural Networks

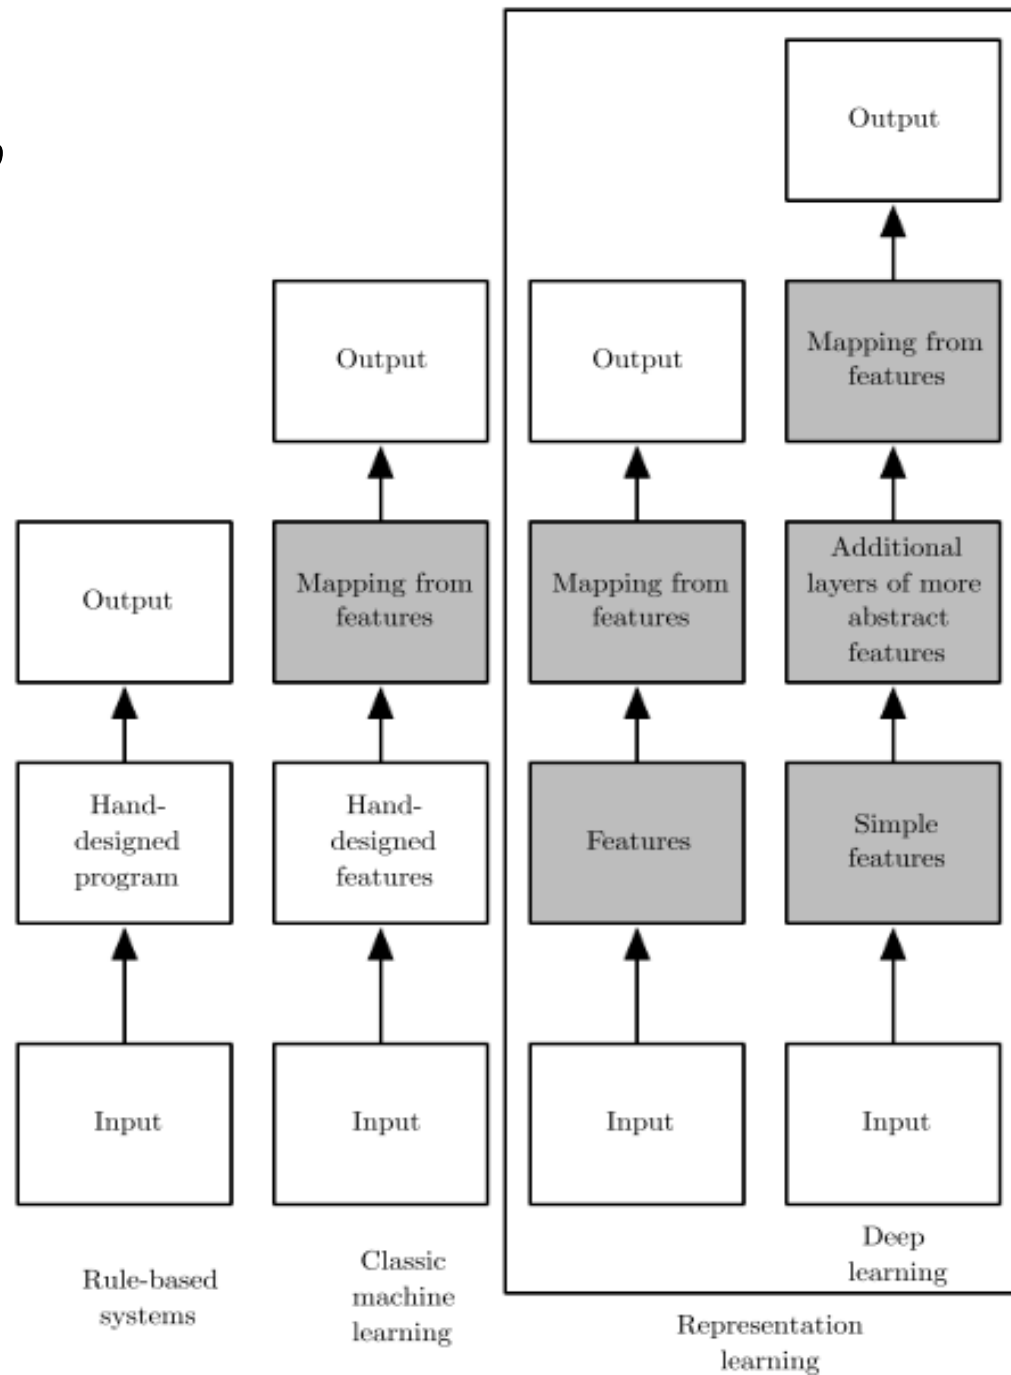

Artificial Neural Networks

Artificial Neural Networks

Three flavors of “AI”

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter
 - Use rule-based systems

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter
 - Use rule-based systems
- If some relevant features are known, but the best values of the parameters are unknown

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter
 - Use rule-based systems
- If some relevant features are known, but the best values of the parameters are unknown
 - Classic machine learning

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter
 - Use rule-based systems
- If some relevant features are known, but the best values of the parameters are unknown
 - Classic machine learning
- If there is no clear set of features that best represent the data

When should you use each flavor of AI?

- If the relevant values and computations are known by the experimenter
 - Use rule-based systems
- If some relevant features are known, but the best values of the parameters are unknown
 - Classic machine learning
- If there is no clear set of features that best represent the data
 - Representation learning/ Deep learning

Biological Example: RNAseq data

- RNAseq data from M and F animals collected at different ages
- You want to determine how variable the samples are and if there are effects of sex and/or age
- You've measured thousands of genes and don't know which genes would be changing

Biological Example: RNAseq data

- RNAseq data from M and F animals collected at different ages
- You want to determine how variable the samples are and if there are effects of sex and/or age
- You've measured thousands of genes and don't know which genes would be changing
- ^We need a better representation of the data to more easily visualize the differences between samples

Biological Example: RNAseq data PCA

Biological Example: Image Segmentation
